

# PostgreSQL Privileges

## 1. Database Level Privileges

These privileges are granted using the `GRANT` command on a database.

| Privilege           | Description                                                                 |
|---------------------|-----------------------------------------------------------------------------|
| CONNECT             | Allows users to connect to the database.                                    |
| CREATE              | Allows users to create new schemas within the database.                     |
| TEMPORARY (or TEMP) | Allows users to create temporary tables.                                    |
| ALL PRIVILEGES      | Grants all database-level privileges (equivalent to CONNECT, CREATE, TEMP). |

### Example:

```
GRANT CONNECT ON DATABASE mydb TO user1;GRANT CREATE ON DATABASE mydb TO user1;
```

---

## 2. Schema Level Privileges

These privileges control access to a specific schema within a database.

| Privilege      | Description                                                                                                   |
|----------------|---------------------------------------------------------------------------------------------------------------|
| CREATE         | Allows users to create tables, views, or other objects within the schema.                                     |
| USAGE          | Allows users to access objects within the schema (needed to use tables, but doesn't allow creating new ones). |
| ALL PRIVILEGES | Grants all schema-level privileges (CREATE, USAGE).                                                           |

### Example:

```
GRANT USAGE ON SCHEMA myschema TO user1;GRANT CREATE ON SCHEMA myschema TO user1;
```

---

### 3. Table Level Privileges

These privileges apply to tables, views, and sequences.

| Privilege      | Description                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------|
| SELECT         | Allows users to read data from the table.                                                          |
| INSERT         | Allows users to insert new rows into the table.                                                    |
| UPDATE         | Allows users to modify existing rows in the table.                                                 |
| DELETE         | Allows users to remove rows from the table.                                                        |
| TRUNCATE       | Allows users to delete all rows from the table.                                                    |
| REFERENCES     | Allows users to create foreign keys referencing the table.                                         |
| TRIGGER        | Allows users to create triggers on the table.                                                      |
| ALL PRIVILEGES | Grants all table-level privileges (SELECT, INSERT, UPDATE, DELETE, TRUNCATE, REFERENCES, TRIGGER). |

#### Example:

```
GRANT SELECT, INSERT ON TABLE mytable TO user1;GRANT ALL PRIVILEGES ON TABLE mytable TO user1;
```

### 5. Role-Based Privileges

Roles in PostgreSQL act as both **users** and **groups**. You can assign privileges to a role and then grant that role to multiple users.

| Privilege   | Description                                            |
|-------------|--------------------------------------------------------|
| LOGIN       | Allows the role to log in to the database.             |
| SUPERUSER   | Grants full control over the database.                 |
| CREATEDB    | Allows the role to create databases.                   |
| CREATEROLE  | Allows the role to create other roles.                 |
| REPLICATION | Grants replication privileges.                         |
| BYPASSRLS   | Allows the role to bypass row-level security policies. |

#### Example:

```
sql
CopyEdit
CREATE ROLE analyst WITH LOGIN PASSWORD 'securepass';GRANT SELECT ON ALL TABLES IN SCHEMA public TO analyst;
```

---

## 6. Column-Level Privileges

Instead of granting permissions on the entire table, you can restrict access to specific columns.

| Privilege            | Description                                    |
|----------------------|------------------------------------------------|
| SELECT (column_name) | Allows reading specific columns.               |
| INSERT (column_name) | Allows inserting values into specific columns. |
| UPDATE (column_name) | Allows modifying values in specific columns.   |

### Example:

```
GRANT SELECT (name, email) ON customers TO analyst;GRANT UPDATE (email) ON customers TO analyst;
```

---

## 7. Sequence-Level Privileges

Sequences are used for generating unique numbers (e.g., auto-incremented IDs). You can control how users interact with them.

| Privilege      | Description                                         |
|----------------|-----------------------------------------------------|
| USAGE          | Allows users to use the sequence but not modify it. |
| SELECT         | Allows reading the sequence's current value.        |
| UPDATE         | Allows modifying the sequence's current value.      |
| ALL PRIVILEGES | Grants all sequence-related privileges.             |

### Example:

```
GRANT USAGE, SELECT ON SEQUENCE orders_id_seq TO user1;
```

---

## 8. Function-Level Privileges

You can allow or restrict execution of stored functions and procedures.

| Privilege | Description                                 |
|-----------|---------------------------------------------|
| EXECUTE   | Allows executing the function or procedure. |

### Example:

```
GRANT EXECUTE ON FUNCTION calculate_discount(integer) TO sales_team;
```

---

## 9. View-Level Privileges

Views are virtual tables that display data from one or more tables. Privileges on views work similarly to tables.

| Privilege | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|
| SELECT    | Allows reading data from the view.                                          |
| INSERT    | Allows inserting data into the underlying table via the view (if possible). |
| UPDATE    | Allows updating data through the view (if possible).                        |
| DELETE    | Allows deleting data through the view (if possible).                        |

### Example:

```
GRANT SELECT ON view_sales TO analyst;
```

---

## 10. Foreign Data Wrapper (FDW) Privileges

PostgreSQL allows access to external databases via **Foreign Data Wrappers (FDW)**. These require special permissions.

| Privilege | Description                                                |
|-----------|------------------------------------------------------------|
| USAGE     | Allows users to use the FDW but not create foreign tables. |
| CREATE    | Allows users to create foreign tables using the FDW.       |

### Example:

```
GRANT USAGE ON FOREIGN DATA WRAPPER my_fdw TO user1;
```

---

## 11. Tablespace-Level Privileges

Tablespaces define where database files are stored. Users need privileges to create objects in them.

| Privilege | Description                                                         |
|-----------|---------------------------------------------------------------------|
| CREATE    | Allows users to create objects (tables, indexes) in the tablespace. |

**Example:**

```
GRANT CREATE ON TABLESPACE mytablespace TO dbuser;
```

---

## 12. Row-Level Security (RLS) Policies

PostgreSQL supports **row-level security (RLS)** to control access to individual rows based on a policy.

| Privilege                 | Description                                     |
|---------------------------|-------------------------------------------------|
| ENABLE ROW LEVEL SECURITY | Enables RLS on a table.                         |
| CREATE POLICY             | Allows users to define policies for row access. |

**Example:**

```
ALTER TABLE employees ENABLE ROW LEVEL SECURITY;CREATE POLICY  
emp_policy ON employees FOR SELECT USING (department = 'IT');
```

---

## 13. Event Trigger Privileges

Triggers can be executed before/after certain database events (e.g., `DDL COMMANDS`).

| Privilege | Description                            |
|-----------|----------------------------------------|
| EXECUTE   | Allows executing the trigger function. |

**Example:**

```
GRANT EXECUTE ON FUNCTION audit_trigger() TO admin_user;
```

## 14. Procedural Language Privileges

PostgreSQL supports various procedural languages (e.g., `plpgsql`, `plpython`, `plperl`). Users need privileges to use them.

| Privilege | Description                                                     |
|-----------|-----------------------------------------------------------------|
| USAGE     | Allows users to write functions in the procedural language.     |
| CREATE    | Allows users to create functions using the procedural language. |

**Example:**

```
GRANT USAGE ON LANGUAGE plpythonu TO user1;
```

---

## 15. Publication & Subscription Privileges

In logical replication, **publications** and **subscriptions** require permissions to control which users can replicate data.

| Privilege | Description                                           |
|-----------|-------------------------------------------------------|
| CREATE    | Allows users to create publications or subscriptions. |
| USAGE     | Allows users to access existing publications.         |

**Example:**

```
GRANT CREATE ON DATABASE mydb TO replication_user;
```

---

## 16. Materialized View Privileges

Materialized views store the result of a query and need to be refreshed periodically.

| Privilege | Description                                     |
|-----------|-------------------------------------------------|
| SELECT    | Allows reading data from the materialized view. |
| REFRESH   | Allows refreshing the materialized view.        |

**Example:**

```
GRANT SELECT, REFRESH ON MATERIALIZED VIEW sales_report TO analyst;
```

---

## 17. Operator Class & Operator Family Privileges

PostgreSQL allows users to define custom operator classes and families, which help in indexing.

| Privilege | Description                                                  |
|-----------|--------------------------------------------------------------|
| USAGE     | Allows using a specific operator class or family in indexes. |

**Example:**

```
GRANT USAGE ON OPERATOR FAMILY pg_catalog.numeric_ops TO user1;
```

---

## 18. Domain-Level Privileges

Domains are user-defined data types that add constraints on top of existing data types.

| Privilege | Description                                   |
|-----------|-----------------------------------------------|
| USAGE     | Allows using the domain in table definitions. |

### Example:

```
GRANT USAGE ON DOMAIN email_domain TO user1;
```

---

## 19. Aggregate Function Privileges

PostgreSQL allows creating **custom aggregate functions** that process multiple rows.

| Privilege | Description                              |
|-----------|------------------------------------------|
| EXECUTE   | Allows executing the aggregate function. |

### Example:

```
GRANT EXECUTE ON FUNCTION my_custom_avg(numeric) TO analyst;
```

---

## 20. Large Object Privileges

PostgreSQL supports storing binary data as **Large Objects (LOBs)**. These objects require special privileges.

| Privilege | Description                        |
|-----------|------------------------------------|
| SELECT    | Allows reading the large object.   |
| UPDATE    | Allows modifying the large object. |
| DELETE    | Allows deleting the large object.  |

### Example:

```
GRANT SELECT, UPDATE ON LARGE OBJECT 123456 TO user1;
```

## 21. Membership & Role Management Privileges

These privileges control **which roles** a user can **manage**.

| Privilege     | Description                                             |
|---------------|---------------------------------------------------------|
| GRANT <ROLE>  | Allows assigning a role to a user.                      |
| REVOKE <ROLE> | Removes role membership from a user.                    |
| ADMIN OPTION  | Allows a user to grant/revoke a role to others.         |
| INHERIT       | Enables a role to inherit privileges from another role. |

**Example:**

```
GRANT manager_role TO user1 WITH ADMIN OPTION;REVOKE manager_role
FROM user1;
```

---

## 22. Table Inheritance Privileges

PostgreSQL allows **table inheritance**, where a child table inherits from a parent.

| Privilege | Description                                                   |
|-----------|---------------------------------------------------------------|
| SELECT    | Allows selecting from the parent table.                       |
| INSERT    | Allows inserting into the parent table (propagated to child). |
| UPDATE    | Allows updating data in the parent table.                     |
| DELETE    | Allows deleting rows in the parent table.                     |

**Example:**

```
GRANT SELECT ON parent_table TO user1;
```

---

## 23. Index-Level Privileges

Indexes improve query performance, but they require underlying **table privileges** to be useful.

| Privilege | Description                                           |
|-----------|-------------------------------------------------------|
| USAGE     | Allows a user to use an index for query optimization. |

**Example:**

```
GRANT USAGE ON INDEX my_index TO user1;
```

---

## 24. Database-Wide Default Privileges

Instead of granting privileges **one by one**, you can define **default privileges** for objects created in the future.

| Privilege                | Description                                 |
|--------------------------|---------------------------------------------|
| ALTER DEFAULT PRIVILEGES | Sets default privileges for future objects. |

**Example:**

```
ALTER DEFAULT PRIVILEGES IN SCHEMA public GRANT SELECT ON TABLES TO analyst;
```

---

## 25. Replication Slot Privileges

For physical or logical replication, replication slots require permission.

| Privilege | Description                              |
|-----------|------------------------------------------|
| USAGE     | Allows a user to use a replication slot. |
| SELECT    | Allows viewing replication slot details. |

**Example:**

```
GRANT USAGE ON REPLICATION SLOT my_slot TO replication_user;
```

---

## 26. Logical Replication Subscription Privileges

Logical replication subscriptions allow specific table replication.

| Privilege | Description                                                 |
|-----------|-------------------------------------------------------------|
| SUBSCRIBE | Allows a user to create a logical replication subscription. |

**Example:**

```
GRANT SUBSCRIBE ON DATABASE mydb TO replication_user;
```

---

## 27. Custom Data Type Privileges

PostgreSQL allows defining **custom data types**.

| Privilege | Description                      |
|-----------|----------------------------------|
| USAGE     | Allows using a custom data type. |

**Example:**

```
GRANT USAGE ON TYPE custom_type TO user1;
```

---

## 28. Text Search Configuration Privileges

Text search configurations are used for **full-text search**.

| Privilege | Description                               |
|-----------|-------------------------------------------|
| USAGE     | Allows using a text search configuration. |

### Example:

```
GRANT USAGE ON TEXT SEARCH CONFIGURATION my_config TO user1;
```

---

## 29. Extension-Level Privileges

Extensions allow additional functionality (e.g., `pg_stat_statements`, `postgis`).

| Privilege | Description                           |
|-----------|---------------------------------------|
| CREATE    | Allows a user to create an extension. |
| USAGE     | Allows using the extension.           |

### Example:

```
GRANT USAGE ON EXTENSION postgis TO gis_user;
```

---

## 30. Foreign Server Privileges

If you're connecting to an external database (via `postgres_fdw`), you can manage access to it.

| Privilege | Description                    |
|-----------|--------------------------------|
| USAGE     | Allows using a foreign server. |

### Example:

```
GRANT USAGE ON FOREIGN SERVER my_remote_server TO remote_user;
```

---

### 31. PostgreSQL Built-in Privileges — Column Format

| Privilege Role            | Purpose                                                                     |
|---------------------------|-----------------------------------------------------------------------------|
| pg_read_all_data          | SELECT from all tables, views, sequences in all databases.                  |
| pg_write_all_data         | INSERT, UPDATE, DELETE on all tables in all databases.                      |
| pg_monitor                | Access monitoring views and functions (pg_stat*).                           |
| pg_read_all_settings      | View PostgreSQL settings (SHOW ALL).                                        |
| pg_read_all_stats         | View system statistics (like locks, table stats).                           |
| pg_stat_scan_tables       | Allow manual ANALYZE execution to scan tables.                              |
| pg_execute_server_program | Allow executing server programs with COPY FROM PROGRAM.                     |
| pg_signal_backend         | Allow sending signals to other backend processes (e.g., terminate queries). |
| replication               | Enable replication (streaming WAL, creating replication slots).             |

Suppose you want to allow user `akash.nishad` to **read everything** from every database without manually granting access database by database.

```
GRANT pg_read_all_data TO akash.nishad;
```
