Procedure to remove archive file

1. Identify the Location: Determine the location of the archive file(s) that you want to remove.

2. Connect to PostgreSQL: Open a command-line interface or a PostgreSQL client and connect to the PostgreSQL database server where you want to remove the archive files

3.Check Archive Command: If you have configured the "archive_command" parameter in the PostgreSQL configuration file (postgresql.conf), make sure it does not interfere with the removal process.
The "archive_command" might be responsible for moving or copying the archive files to another location.

4.Before removing the archive files, it is recommended to stop the PostgreSQL server

5.Remove Archive Files:-
 Syntax:- sudo rm /file_path

            (OR)

Run pg_archivecleanup: Open a command-line interface and navigate to the directory where the pg_archivecleanup utility is located. This utility is typically found in the PostgreSQL bin directory.

Syntax:- ./pg_archivecleanup <path_to_archive_directory> <last_removed_segment>

Example:- ./pg_archivecleanup /path/to/pg_wal 0000001000000B

6. start postgresql:-
   Systemctl start postgresql-14
